

TANAEL, BRIAN JOSHUA P.
BSIT - 3202

TASK 1 (PAGE 4):

Direction: Analyze the given questions below and provide the correct answer on a separate sheet of paper.

1. How does Information Assurance matter in your current organization?

-It's super important in our school organizations and management because it keeps all our private student data safe from getting hacked, which basically saves us from massive headaches and ruined projects.

2. What is the role of Information Assurance and Security in your daily work Cycle as students? Explain and create your own scenario based on how you implement Information Assurance Security in your daily life?

-It acts like a digital bodyguard for my school stuff, like when I use two-factor authentication so no one messes with my student portal, giving me peace of mind so I don't stress about my grades getting deleted or alter my stuff in the portal

3. Explain the importance of Information Assurance and Security.

-It's basically what stops hackers from stealing our personal info or breaking the websites we rely on, meaning we can actually focus on whatever we want to do instead of dealing with cyber attacks and threats.

TASK 2 (PAGE 8):

Direction: Analyze the given questions below and provide the correct answer on a separate sheet of paper.

1. Given that someone already infiltrated your network (via web-based systems, networks, or human users). As an IT practitioner, what will you do in this kind of situation?

-If someone infiltrated our network, I'd immediately disconnect the infected computers from the Wi-Fi to stop the hacker from doing more damage, and then I'd trace how they got into the system so we can patch that hole before they steal anything else.

2. In your current state of knowledge as an IT practitioner, what are the best measures to avoid APT attacks?

-As an IT student, the best way to dodge these sneaky, long-term attacks is to keep all our software updated, remind everyone not to click on

sketchy email links, and strictly limit who has access to the really important admin stuff.

3. In your own opinion, what are the factors to consider why individual are vulnerable to APT attackers?

-People usually fall for these targeted attacks because they get tricked by really convincing fake messages or just don't pay enough attention to basic online safety rules, which is exactly why we need better, real-world training on how to spot scams.
